

Round 1:

Round 1 of the module will be carried out over a total duration of 60 minutes.

The round consists of 30 multiple-choice questions followed by 3 structured short-answer questions, and both sections must be completed within the 1-hour time limit.

This format is designed to test both breadth of knowledge through the MCQs and depth of conceptual understanding through the structured questions. The MCQs assess speed and application, while the structured questions evaluate reasoning, calculation, and problem-solving skills.

This Round Will Cover Major Domains Such As:

- Kinematics & Motion
- Force & Dynamics
- Waves & Sound
- Nuclear Physics
- Electricity & Circuits
- Work & Energy
- Capacitance & Charge
- Oscillations
- Circular Motion
- Medical Physics
- Quantum Physics
- Fluid Pressure
- Ray Tracing & Optics

The round will be scored on total marks from both the MCQs and structured questions.

Round 2 :

The Buzzer Round is designed to test quick thinking, conceptual understanding, and teamwork under pressure. It consists of three exciting segments, each focusing on a different skill: speed, visual reasoning, and rapid problem-solving. A set amount of teams will be go against one another (i.e 4 teams will go against each other) and points will be recorded for each team.

Once the buzzer is pressed each team will have only 5 seconds to answer the question

The top 2-3 teams will qualify for the final round.

Most of the questions will be from the same topics as the ones given above in round 1's section, but do know they will be mostly regarding general physics.

To prepare we suggest you strengthen your grasp across the basics of multiple topics areas of physics. We also suggest that you make sure that you are confident in your answers and answer within the time limit because **there will be negative marking for wrong answers.**

Round 3 - Final

This will be a PYNT / PYPT inspired round. Participants will be expected to design power point presentations on a topic that will be handed out to them at the end of Round 2.

Please note that the topic given to each team will be **randomised** and handed out in front of the delegates to ensure fairness is maintained.

The given topic will be designed in such a way that an experimental data would be needed to produce a conclusion, and therefore, the experiments must take place on spot.

Every team will have around 1 hour to conduct experiments on the campus - all necessary equipment for the experiments will be provided.

Teams then need to use the data to reach a conclusion. For the theory part of a problem, it should be made before the Final round due to the time limitations on the final day.

Note: Prior to Round 3 you will receive marking sheets that will guide you on what we expect of your presentations.
